GLOBALIZATION AND TRANSNATIONALIZATION OF STATE ECONOMY

Globalization is a process that turns the world into a single global system. Globalization is one of the patterns of world development, and it reflects the interdependence of countries' economies in shaping economic space where the branch structure, exchange of information and technology, and location of productive forces are determined by the global situation and the stages of social reproduction acquire planetary scale.

On the global stage take place significant changes that over time will determine the main directions of development of mankind. As a result of global transformations, there form entirely new features of world order and international processes appear as contradictory tendencies, there always appear new challenges and threats to international security. Development of countries is closely associated with the formation of the modern global space security and stability. In the

third millennium, any country can stay out of development if its leaders do not take account of the new requirements and rules generated in the security space.

Transnationalization of economy of Ukraine is a natural phenomenon caused by the processes of globalization, i.e. economic processes, including global reorganization of world production and involvement of Ukraine into these global economic changes. The influence of TNCs on the economic, political and social spheres of states can not be evaluated unambiguously: positively or negatively. However, despite some contradictory relationships between national governments and multinational corporations, there is an obvious result of collaboration of international companies and their combined impact on the global economy. Globalization trends influence all internal processes and phenomena that require the states to adapt to changes.
